

## **Annotation**

At the current market continues to struggle for the client, which requires the system to maximum efficiency along with low price. Professionals from various industries, and the computer one - is no exception, are trying to connect these two competing concepts. For example, in graphics system's industries, it will look as follows: how to display the most high-quality moving image and the main requirement is that the client does not distinguish it from reality, even affecting the sequence of events in the proposed image. All work is assigned to the processor and graphics card. How to use them well? Using finite element method, together with modern technologies and the proposals on the market, we can hasten the hour when the market will be the perfect value-for-money.
